Task1: Vulnerability Assessment Report

Website Tested: TestPHP VulnWeb
Scope: Public pages only, passive, read-only
Tools Used: Nmap, Browser DevTools, OWASP ZAP (passive), securityheaders.com
Date: 28 February 2026
Prepared by: Zamzam Hassan Ali

1. Executive Summary

This assessment evaluates the publicly accessible security configuration of TestPHP VulnWeb. The analysis was **passive and read-only**, following ethical guidelines.

The goal is to identify **common security weaknesses**, classify risks in a business-friendly way, and provide practical recommendations for remediation.

Key findings include missing security headers, server information disclosure, and minor configuration issues.

2. Methodology / Tools Used

Section	Details
Website Tested	http://testphp.vulnweb.com
Scope	Public pages only, read-only, passive scanning
Tools Used	Nmap, Browser DevTools, OWASP ZAP (passive), securityheaders.com
Notes	No login attempts, no exploitation, no active scanning

Methodology:

1. Nmap used to identify open ports (Port 80).
2. Browser DevTools checked HTTP headers, cookies, server information.
3. securityheaders.com tested for missing or insecure headers.

4. OWASP ZAP performed passive scan to detect configuration and header issues on public pages.

3. Findings

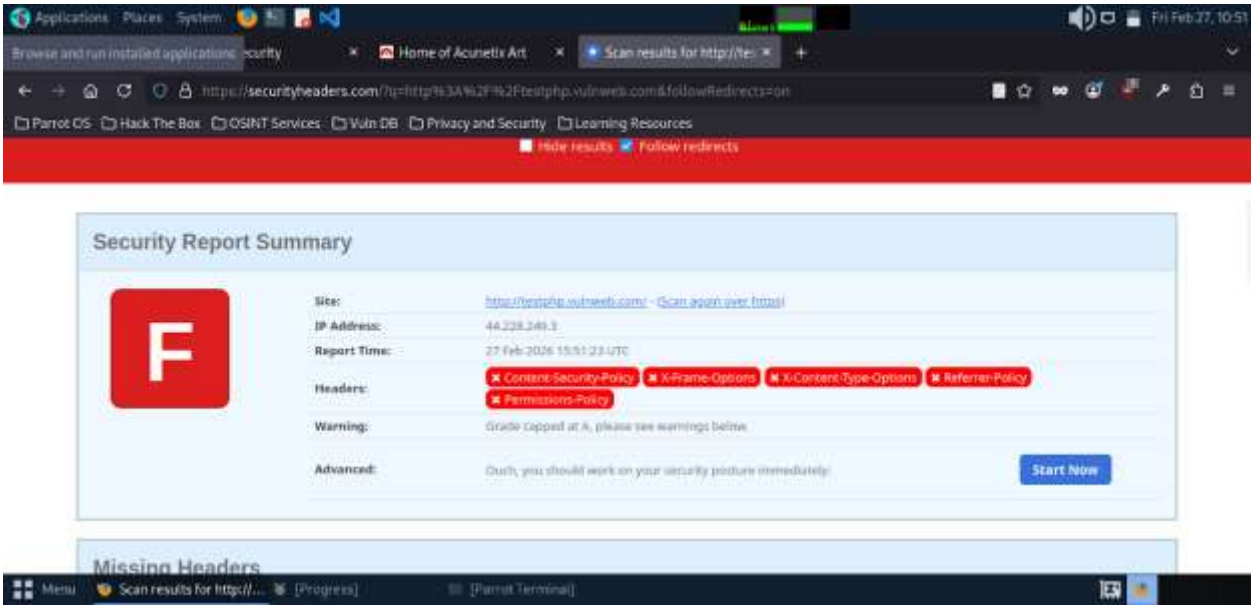
#	Finding	Risk	Explanation (Non-technical)	Recommendation
1	Missing Content-Security-Policy	Medium	Browser cannot block some malicious scripts from untrusted sites	Add CSP header in web server configuration
2	Missing Anti-Clickjacking (X-Frame-Options)	Medium	Website could be embedded in another site to trick users	Add X-Frame-Options header (DENY or SAMEORIGIN)
3	X-Content-Type-Options missing	Low	Browser may misinterpret file types, causing security issues	Add X-Content-Type-Options: nosniff
4	Server reveals backend via X-Powered-By	Low	Exposes server technology to attackers	Remove X-Powered-By header from server
5	Charset mismatch	Informational	Character encoding is not clearly specified	Specify UTF-8 charset in headers
6	HTTP only (no HTTPS)	High	Data is transmitted unencrypted and can be intercepted	Implement HTTPS & HSTS

Note: This report only includes passive, read-only findings. No login attempts, brute force, or exploitation were performed.

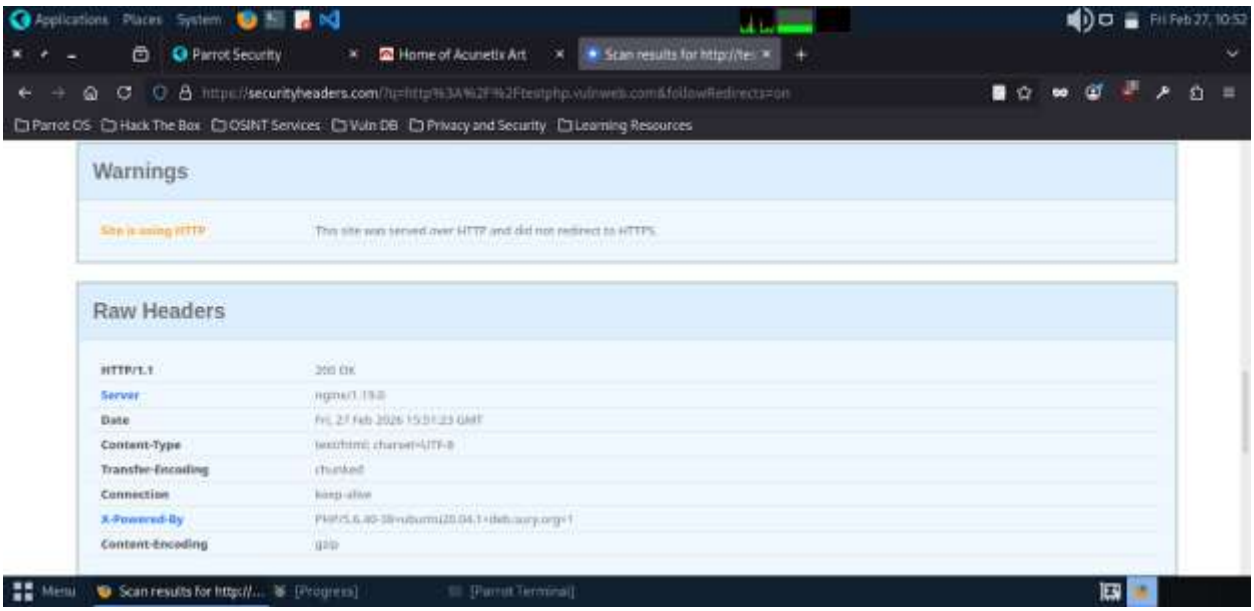
4. Evidence

Include the following screenshots:

1. Browser DevTools → Missing security headers (CSP, X-Frame-Options, X-Content-Type-Options)
2. securityheaders.com screenshot → F grade



3. Server information (X-Powered-By / Server header)



4. ZAP Alerts → passive scan

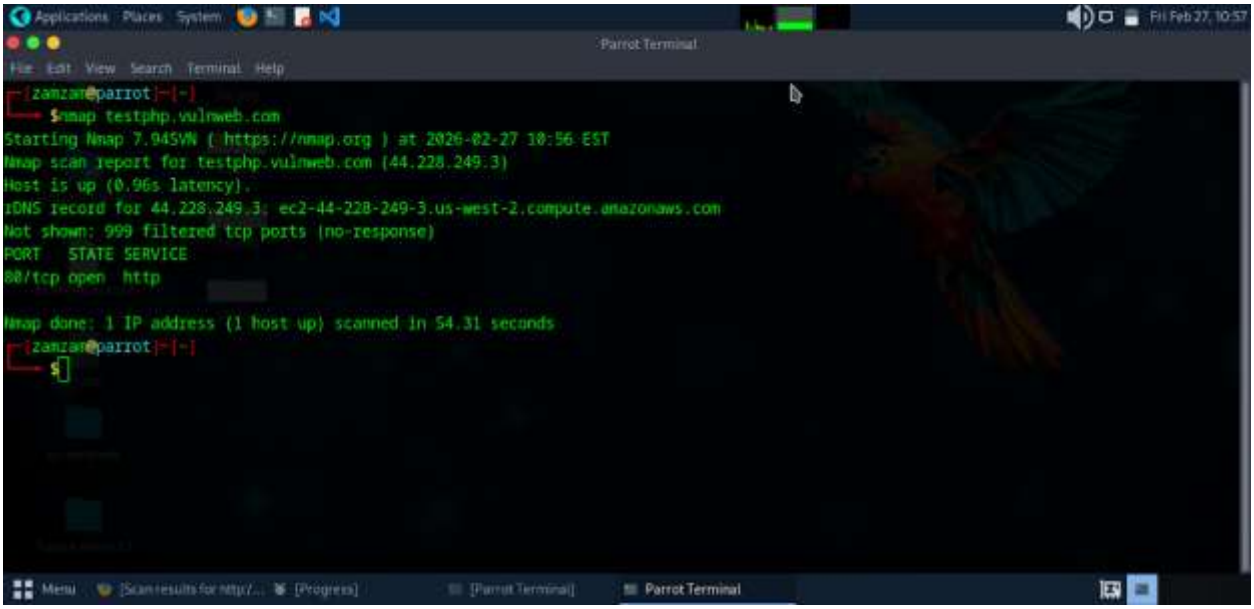
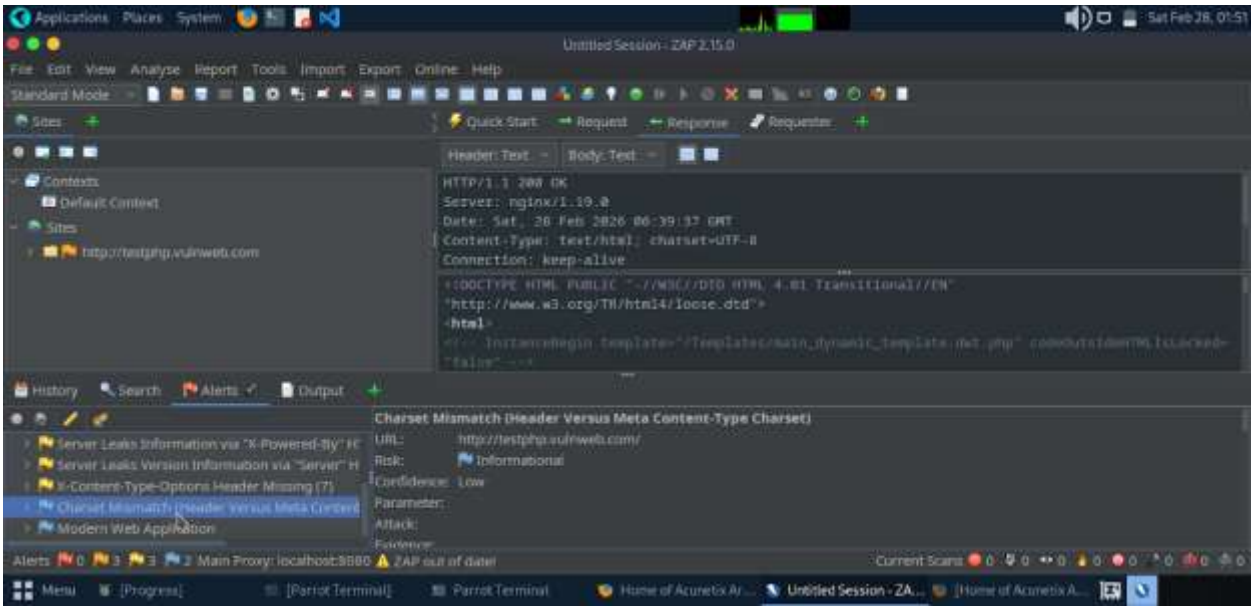
5. Nmap scan → Port 80 open



6. Charset mismatch evidence



5. Recommendations

1. Implement HTTPS & enforce HSTS.
2. Add missing security headers: Content-Security-Policy, X-Frame-Options, X-Content-Type-Options.
3. Hide server information and backend technology (remove X-Powered-By header).
4. Specify proper charset (UTF-8) for all pages.
5. Continue passive monitoring for future changes.
